

Lesson Objective

Solve equivalent ratio problems by finding the rate per 1 in a table.

Materials

Activity 1 worksheet

PROBLEM

- 1 Complete a table to find the rate per 1 and other equivalent ratios.

A popcorn machine pops 12 bags of popcorn in 4 minutes.
Complete the table. Explain how you found each missing value.

Time (minutes)	Bags of popcorn
4	12
1	3
10	30

TEACHER GUIDANCE

Guide students through completing the table.

The focus should be on finding the multiplier that relates two corresponding values in different rows (e.g., “What times 4 equals 1?”).
Remind students that dividing by a whole number is the same as multiplying by its reciprocal (a unit fraction).

Model how to show work by drawing arrows and showing the multiplication used to relate corresponding values in different rows (e.g., “1/4”).

- 2 Use a table of equivalent ratios to answer questions.

A candy store sells 6 pieces of candy for \$3. Use the table to answer the questions.

Cost (dollars)	Pieces of Candy
\$3	6

Work with students to solve part (a).
Consider the benefits of finding the cost for 1 piece of candy of the number of pieces of candy for \$1.

Students work on part (b) independently.

- a. At this rate, how much would 9 pieces of candy cost?
Answer: \$4.50.
- b. How many pieces of candy can you buy for \$10?
Answer: 20 pieces.
